## WATER INJECTION AND JETTING SYSTEMS

The **A**rt of Powerful Cleaning...

**Aquablast Ring**, this low cost device is ideal in containing dust and abrasive and fits quickly to your standard blast nozzle and works by forcing water onto the blast stream as it exits the nozzle.

The second option are **Water Induction Nozzles** of the venturi principle drawing or inducting water from a low pressure line into the abrasive and airstream. This is opposed to trying to force or inject water into the stream. The major advantages with this type of nozzle are the water economy given and the higher performance rates achieved.

Airblast's top of the range **Cleanblast** units are designed to be used with most types of air operated blast cleaning equipment. They are the most versatile units on the market giving both single and twin operator capabilities. When used with the Airblast remote controlled abrasive metering valve they

allow the operator to wash down blast cleaned surfaces with air and water to remove dust particles.

**High Pressure Water Jetting**, The versatile Airblast range of water jetting units are manufactured with high pressure horizontal triplex positive displacement plunger or piston type pumps being of compact construction with exceptional high performance per weight ratio. The various models for practical work range from 1600 litres a minute and pressures up to 1000 bar. Complementing the pumps are a full range of jetting tools and accessories covering guns, round and flat jet nozzles, tube and pipe cleaning nozzles and one or two plane rotating nozzles. Also available are quick closing hand or foot operated valves and special hoses for operating pressures up to a 1000 bar (14.220 psi).

### Water systems

Airblast manufactures and supplies a full range of water injection equipment and nozzles developed over a number of years to suit the contractor's needs to eliminate dust when abrasive blasting.
